Thanks to their Precision Profile® Design, Alcon multifocal contact lenses have revolutionized my approach to treating presbyopia. With DAILIES TOTAL1® Multifocal contact lenses, I know that I can change patients’ lives by reducing their dependency on glasses, giving them clear vision at all distances, and providing the convenience of a daily disposable wear schedule. At the core of this opportunity is the simplicity of fitting Alcon multifocal contact lenses, which all feature the same optical design and fitting process. While some earlier multifocal designs were complex to fit (to say the least), the Alcon design and fitting guide make it easy to fit and meet the individual needs of my patients. From my experience, following the 2-step initial fitting guide and embracing its simplicity can lead to high fit success rates right off the bat. The optics of Alcon’s Precision Profile® Design are also key to patient success. In contrast to monovision, in which patients essentially change how they use their eyes, Precision Profile® Design enables binocular vision at all distances. By fitting DAILIES TOTAL1® Multifocal contact lenses, I can help patients feel young again.

When fitting DAILIES TOTAL1® Multifocal contact lenses, I always help patients understand what they can expect as they adapt to the lenses, emphasizing that they will notice improvements during the adaptation period. Patients’ excitement about the lenses has typically grown by the time I see them at follow-up, thanks to the visual acuity, comfort, and lifestyle benefits they are experiencing.

For eye care professionals wanting to make a real difference in patients’ lives, it does not get much better than being able to offer presbyopes Alcon multifocal contact lenses, and in particular, DAILIES TOTAL1® Multifocal. If you do not currently offer DAILIES TOTAL1® Multifocal contact lenses to your presbyopic patients, now is the time to start and see how it changes your practice.
